CORE CAPABILITIES OF GEODICT®

GEODICT[®] SOLUTIONS FOR ...

Filtration	For a clean environment	
Electrochemistry	For electromobility	
Structural Materials	For lightweight applications	
Digital Rock Physics	For efficient energy production	

TYPICAL WORKFLOW WITH GEODICT®

GEODICT

1. Import

2. ANALYZE

3. MODEL

4. DESIGN

>>

captured by μ CT or FIB/SEM techniques

Digital Material

In-depth digital analysis and evaluation of material properties

Quantification of geometrical, structural, and physical material properties Digital material design based on the statistical material properties

Digital Twin

Design by varying the statistics of the geometry that govern the material properties

Digital Prototypes

ANALYSIS WITH GEODICT[®]

NCA-LCO-CATHODE			
26% Electrolyte			
35% NCA			
24% LCO			

15% Carbon+Binder

MODELLING WITH GEODICT®

GEODICT

. 2. **3.** MODEL

The structural statistical information output of **GrainFind** is the input for **GrainGeo** and **FiberGeo**, the GeoDict® modules for the generation digital twins of the material.

GrainGeo

FiberGeo

- Creates models of granular materials
- Here, it is used to model the structure of the active material

Creates models of fibrous materials

 Here, it is used to model the fibrous binder

> Result: Digital Twin

4. DESIGN

MATERIAL DESIGN WITH GEODICT®

GEODICT

1. 2. 3. 4. DESIGN

Digital prototypes

Digital prototypes are quickly designed by varying the statistics of the geometry that govern the material properties.

Many digital prototypes of the cathode are swiftly and directly analyzed on the computer.

Result: Selection of digital prototypes with different volume fractions

GEODICT MODULES AND SIMULATIONS USED

- ImportGeo to process the image data
- **GrainGeo** to generate artificial cathode structures
- GrainFind to analyze granular structures for its geometrical properties
- DiffuDict to predict diffusivity and tortuosity

IMPORTGEO AND DATA SAMPLE USED

GEODICT

For this talk we use a data set kindly provided by:

KIT (Karlsruher Institute of Technology)

Nickel Cobalt Manganese (NMC)cathode

These data and further information such as tortuosity values can be found

in Tortuosity Anisotropy in Lithium-Ion Battery Electrodes^[1],

^[1] Tortuosity Anisotropy in Lithium-Ion Battery Electrodes: Martin Ebner, Ding-Wen Chung, R. Edwin García and Vanessa Wood

-- 11 --

© Math2Market GmbH

GEOMETRIC ANALYSIS TOOL GRAINFIND

- Some of the results per grain:
 - Volumes and diameters of volume-equivalent sphere
 - Diameters of inscribed spheres
 - Sheppard sphericities and Krumbein sphericities
 - Fit shape's diameters, direction, and orientation
- Statistics about grains
 - Volume statistics
 - Diameter statistics
 - Sphericity statistics
 - Fit-shape direction statistics
- Classification of grain shapes

© Math2Market GmbH

CATHODE CREATION TOOL GRAINGEO

- GrainGeo generates granular structures
- Different kind of grains can be generated:
 - Spheres and ellipsoids (described by their diameters)
 - Convex polyhedrons (described by diameters of enclosing ellipsoid)

-- 13 --

- Many others
- Objects can be randomly created
- Overlapping objects can be created
- Or overlap can be removed

© Math2Market GmbH

SIMULATION TOOLS DIFFUDICT

DiffuDict simulates diffusion experiments of Bulk and Knudsen diffusion:

- Effective diffusivity
- Tortuosity:
 - For a curve (blue) in space, the tortuosity of this curve is the quotient between the length of the curve L and the length of the straight line I between the curve's endpoints (red), $\tau = \frac{L}{l}$

AGENDA

GEODICT

2 Motivation

- **3** Step 1: NMC cathode recreation using GeoDict only
- **4** Step 2: NMC cathode recreation using GeoDict and optiSLang

MOTIVATION FOR DIGITAL EXPERIMENTS

- To reduce time and costs in cathode development processes:
 - Experiments can be performed digitally
 - Testing digital prototypes allows to only produce the most promising
- Use digital twin of cathode to understand real cathode better
 - Use this twin to see how changes to this cathode alter the performance
 - Develop the next generation cathode based on real cathode
- \rightarrow But therefore we need the digital twin
- Obtain it by importing 3d FIB-SEM image stack
- Or use single 2d SEM image

MOTIVATION FOR USING SEM

For digital experiments reliable digital representatives of the cathode material is needed:

- Import sample from FIB-SEMs
 - + This yields exact digital representative
 - More expensive
 - Sample is destroyed in the process
- Import sample from single SEM image
 - + Sample is not destroyed
 - + Cheaper than 3d scans
 - No 3d representation
- → Develop methodoology to create 3d digital twin from a single SEM image with optiSLang and GeoDict.

3D RECONSTRUCTION FROM **2D** SCAN CHALLENGES

Main Problem is that **Information is missing!**

Where to get information for reliable 3d reconstruction?

- Knowledge from similar cathodes
- Knowledge from manufacturers
- Experimental Input:
 - Porosimetry by mercury intrusion
 - Porosity
 - Tortuosity
 - Permeabilities

 \rightarrow Obtain geometric information of 2d scan by GeoDict and combine with external inputs

3D RECONSTRUCTION FROM 2D SCAN METHODOLOGY VALIDATION

- 1. Use 3d scan of NMC cathode
- 2. Take 2d slice as "SEM scan"
- 3. Reconstruct 3d digital cathode
- 4. Validate results with 3d scan from 1.

AGENDA

GEODICT

- What is GeoDict and Data for this talk
- 2 Motivation and methodology

Step 1: NMC cathode recreation using GeoDict only

Step 2: NMC cathode recreation using GeoDict and optiSLang

STEP 1: NMC RECREATION TOOLS AND PREREQUISITES

For the NMC cathode in *Tortuosity Anisotropy in Lithium-Ion Battery Electrodes*^[1],

tortuosity values are given.

Workflow:

- 1. Use GrainFind on 2d scan
- 2. Recreate 3d cathode with 2d GrainFind information
 - Use GrainGeo for creation of artificial cathodes
- 3. Compare cathodes for their **tortuosities** from [1] and **porosity**

^[1] Tortuosity Anisotropy in Lithium-Ion Battery Electrodes: Martin Ebner, Ding-Wen Chung, R. Edwin García and Vanessa Wood

© Math2Market GmbH

STEP 1: NMC RECREATION WITH GRAINFIND

Take 2d slice of NMC scan

Use **GrainFind** to identify grains and obtain statistics

And create artificial cathode

STEP 1: NMC VALIDATION OF 3D REPRESENTATION

STEP 1: NMC VALIDATION OF 3D REPRESENTATION

Take 2d slice of 3d scan

Take 2d slice of digital cathode

GEODICT

© Math2Market GmbH

-- 24 --

STEP 1: NMC RECREATION WITH GRAINFIND VALIDATION RESULTS

Comparison of computed calibration parameters

	Sample	Reconstruction	Relative Error /(%)
Mean of shortest Diameter	4.98 µm	7.42 μm	49
Mean of intermediate Diameter	6.52 µm	10.64 µm	63
Mean of longest Diameter	12.94 μm	15.47 μm	20
Tortuosity x	1.212	1.38	12
Tortuosity y	1.22	1.21	0.2
Tortuosity z	1.24	1.22	2
Porosity	49.97 %	49.79%	0.3

 \rightarrow Physical properties almost good, geometric properties not sufficiently accurate

AGENDA

GEODICT

- 2 Motivation
- **3** Step 1: NMC cathode recreation using GeoDict only

-- 26 --

Step 2: NMC cathode recreation using GeoDict and optiSLang

STEP 2: NMC RECREATION GEODICT EXTENDED BY OPTISLANG

GeoDict Workflow is basis for Sensitivity analysis:

Input parameters for Sensitivity analysis:

- Porosity
- Grain diameters in x, y and z direction (Assume 3 different kind of grains)

-- 27 --

Grain orientations

As responses use geometric and physical properties.

- **Tortuosity** and **porosity** (physical properties)
- **GrainFind** results (geometric properties)

Later apply optimization routine on the obtained MOP

STEP 2: NMC RECREATION GEODICT OPTISLANG WORKFLOW

optiSLang workflow is simple and does not need large complexity:

150 designs calculated +1 validator system

STEP 2: NMC ANALYSIS BY OPTISLANG: SENSITIVITY

3.5

Tortuosity_x

2

0.2 0.4 0.6 0.8

 $\begin{array}{c} 0.6 & 0.8 & 1 \\ Grain2_dia1_[1e-5] \\ 1.4 & 1.6 \end{array}$

0.8

Orientation in y direction is dependend on:

- Input orientation in y direction
- Input orientation in z direction
- \rightarrow Expected and necessary criterion!

Tortuosity in x direction:

- Orientation in x direction
- Acceptable coefficient of prognosis
- ightarrow For later studies more designs should be calculated

STEP 2: NMC ANALYSIS BY OPTISLANG: OPTIMIZATION ON MOP

Knowledge from Step 1:

	Sample	Reconstruction	Relative Error /(%)]
Mean of shortest Diameter	4.98 µm	7.42 μm	49	- 200/
Mean of intermediate Diameter	6.52 µm	10.64 µm	63	$\leq 20\%$
Mean of longest Diameter	12.94 µm	15.47 μm	20	
Tortuosity x	1.212	1.38	12	
Tortuosity y	1.22	1.21	0.2	
Tortuosity z	1.24	1.22	2	$\leq 10\%$
Porosity	49.97 %	49.79%	0.3	

Improve the Diameter results \rightarrow set those as constrains: rel. error $\leq 20\%$ Improve the physical results:

- Already pretty good so set constrained with rel. error $\leq 10\%$
- Tortuosity in x direction as optimization variable

STEP 2: NMC ANALYSIS BY OPTISLANG: RESULTING CATHODE

STEP 2: NMC VALIDATION OF 3D REPRESENTATION

GEODICT

© Math2Market GmbH

2 MARKE

STEP 2: NMC VALIDATION OF 3D REPRESENTATION

Take 2d slice of 3d scan

Take 2d slice of digital cathode

STEP 2: NMC ANALYSIS BY OPTISLANG: OPTIMIZATION RESULTS

As criteria we use results from Step 1:

	Sample	Reconstruction	Relative Error /(%)
Mean of shortest Diameter	4.98 µm	4.23 μm	15
Mean of intermediate Diameter	6.52 µm	5.30 µm	19
Mean of longest Diameter	12.94 μm	13.27 μm	3
Tortuosity x	1.212	1.25	3
Tortuosity y	1.22	1.28	5
Tortuosity z	1.24	1.30	5
Porosity	49.97 %	47.06%	6

All constraints and optimization variables are within bounds!

Some are at their limit, but did not exceed it

 \rightarrow This artificial cathode is a digital twin for tortuosity and diffusivity

© Math2Market GmbH

CONCLUSION AND OUTLOOK

- Recreating an artificial cathode with standalone GrainFind and GrainGeo tools already yields good results
- But in combination with optiSLang results are improved
 - More designs for Sensitivity should be considered
- This methodology is applicable to homogenous cathodes very good
 But:
- For inhomogeneous cathode this methodology can work but:
 - Needs more inputs
 - Needs to be extended and validated

THANK YOU FOR YOUR ATTENTION!
