

Optimization Strategies for the Development of Vascular Stents.

Nils Götzen
André Schoof

Agenda

- Introduction
- Stent Development
- Design Optimization
- Optimization Strategy
- Conclusion & Outlook

Coronary Angioplasty With Stent Placement

- Atherosclerosis is plaque build-up inside the coronary arteries
- most common type of heart disease
- leading cause of death in EU/US
- lifestyle changes & medicines effective treatment at early stage of the disease

Coronary Angioplasty With Stent Placement

- one of the most important achievements of the last years in interventional cardiology
- balloon is inflated to compress the plaque
- stent expands and attaches to the artery wall
- stent stabilizes opened vessel until the healing process has finished

Stent System Assembly

Stent-Delivery-System

Stent mounted on Delivery System

Design Development Circle

- closely integrated CAD + FEA is used from the early development phase on
- parametric CAD geometry
- numerical evaluation
- parameter analysis + optimization
- prototyping + experimental evaluation

From 3D to 2D and back again

From 3D to 2D and back again

Strategy – CAD

- parametric geometry model with Solid Edge
- independent design features are important for minimum of cross-correlation
- geometry parameters
 - meander width
 - outer crown arc radii
 - inner crown arc radii
 - strut widths
 - strut angle
 - offset values etc.

Strategy – FEA

- FE model generation in ANSYS Workbench (WB)
bi-directional interface with Solid Edge
- cyclic BC with CEs (APDL scripts)
- non-linear 2D Solution
 - non-linear material model
 - large strain kinematics
 - contact modeling

Load Steps

- crimping – radial compression (mounting on balloon)
- dilatation – radial expansion (balloon expansion)
- recoil – radial spring back
- compliance – radial reaction force
- 18 load steps
- run time: ca. 2-4 min.

Strategy – FEA

- Script based post-processing in WB
- output parameter definition
 - equivalent plastic strain at arc radii
 - strain distribution in arcs
 - radial compliance
 - self contact forces
 - overall min. strut width
- export of WB to optiSLang project

Review

- in the past: optimization as “trial and error approach”
- sensitivity analyses of design parameters using WB Design-Xplorer – limited success
- recently few true optimization studies were published
- using parametric modeling in ANSYS Classics & RSM approach
- or mesh-morphing as modeling tool with ARSM approach
- reduced dimensions in design space

Wu, W. et al., 2010, Annals of Biomedical Engineering

Strategy – optiSLang – DOE

- prior to DOE, input parameters: 31 ; output parameters: 63
- definition of BCs & objective function
- objective function
 - compliance +
 - compliance range +
 - strain distribution (4x) +
 - mean contact forces +
 - var contact forces
- latin hypercube sampling
- $N = 600$ (wall clock $\approx 12\text{h}$)
- parameter range $\approx \pm 20\%$

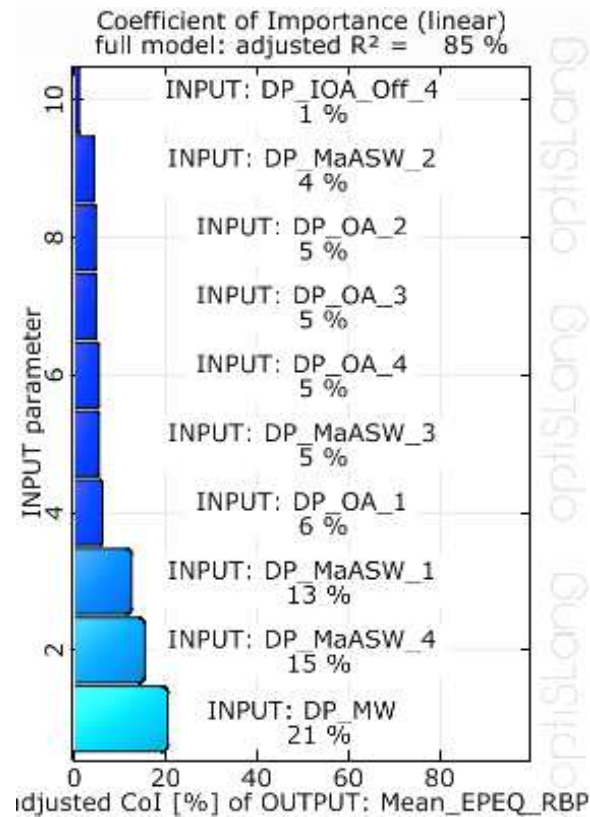

Optimization Strategy

Strategy – optiSLang – DOE

compliance

pl. strain

**contact
pressure**

Strategy – optiSLang – DOE

max. plastic strain
vs. compliance

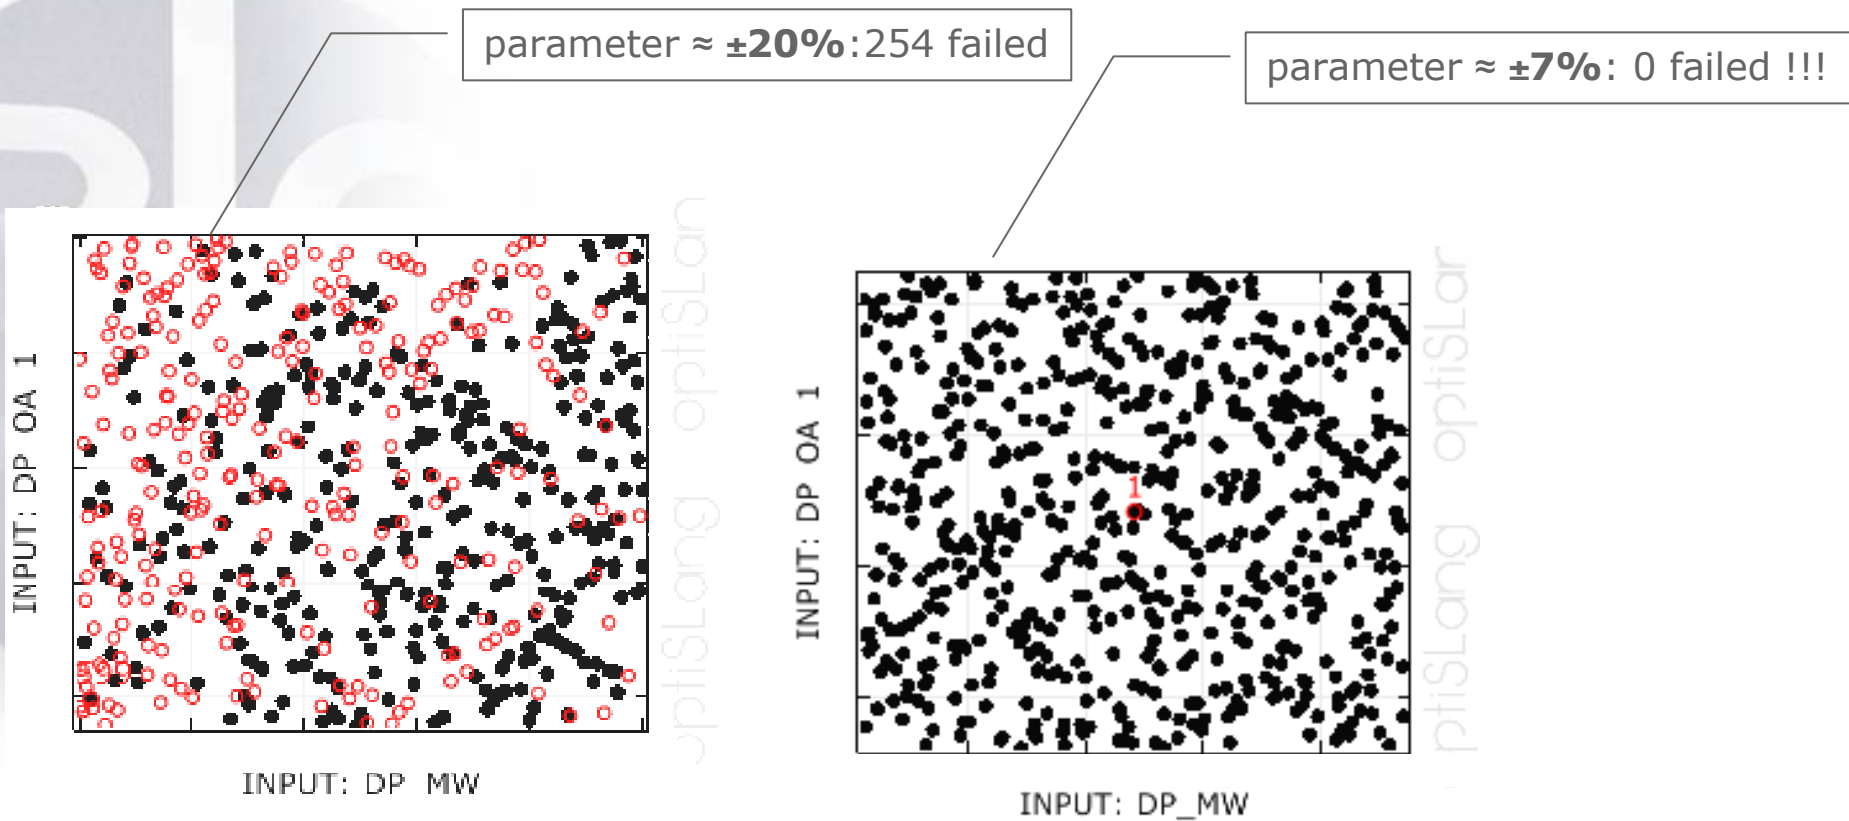

max. plastic strain
vs. strut width

max. plastic strain vs.
strut width & meander width

Strategy – optiSLang – DOE

Strategy – optiSLang – ARSM

- initial parameter are selected based on COI (DOE)
- 1st loop:
 - design parameters:
 - meander width
 - max. arc strut width (4x)
 - arc radii (4x)
 - radius offset (4)
 - $\pm 20\%$ parameter range
 - GA/NLPQLP
 - 20 iterations
 - up 10h wall clock time per ARSM loop (300-600 simulations)

Strategy – optiSLang – ARSM

- following loops (up to 8 loops):
 - start design = best design from previous loop
 - design parameters = combination of few initial and new parameters
 - less important variable will be replaced by new ones
 - parameter range will be reduced stepwise down to $\pm 3\%$
 - 20-30 iterations

Strategy – optiSLang – Results

■ Boundary Conditions

Minimum Strut Width

■ Objective Terms

Radial Compliance

Plastic Strain

Inhomogeneous strain distribution

optiSLang

- 1 year intense usage & experience of optiSLang at Cortronik Stent Development
 - proofed to be very successful and highly effective
 - confidence with new tools & algorithms
 - new challenges in terms of model generation (stability) & formulation of objective function
-
- extended usage planned – robustness analyses
 - include geometrical variance (production tolerance)
 - include scatter of material properties (elongation fracture)
